

Rediscovery: Presidential airship concept

Peter Lobner, 5 August 2019

This 2009 airship concept, designed by Alex Schulz, is intended for use by the President and staff members as a mobile part of the White House. The airship includes workspaces, accommodations, communication systems and other features needed to support their daily activities. The design includes an airship dock at a futuristic White House.

The renderings depict an airship that is capable of vertical takeoff and landing (VTOL) and hovering. It could be useful for supporting a Presidential delegation visiting a disaster site in need of federal emergency response support.

As a symbol, the Rediscovery airship was intended to promote a worldwide exchange of “new regenerative technologies,” as embodied in the zero-emissions airship used by the US President.

You’ll find more details on the Rediscovery airship on the Tuvie website at the following link. This was the source of the graphics in this section.
